Jason Stacy Portfolio Website
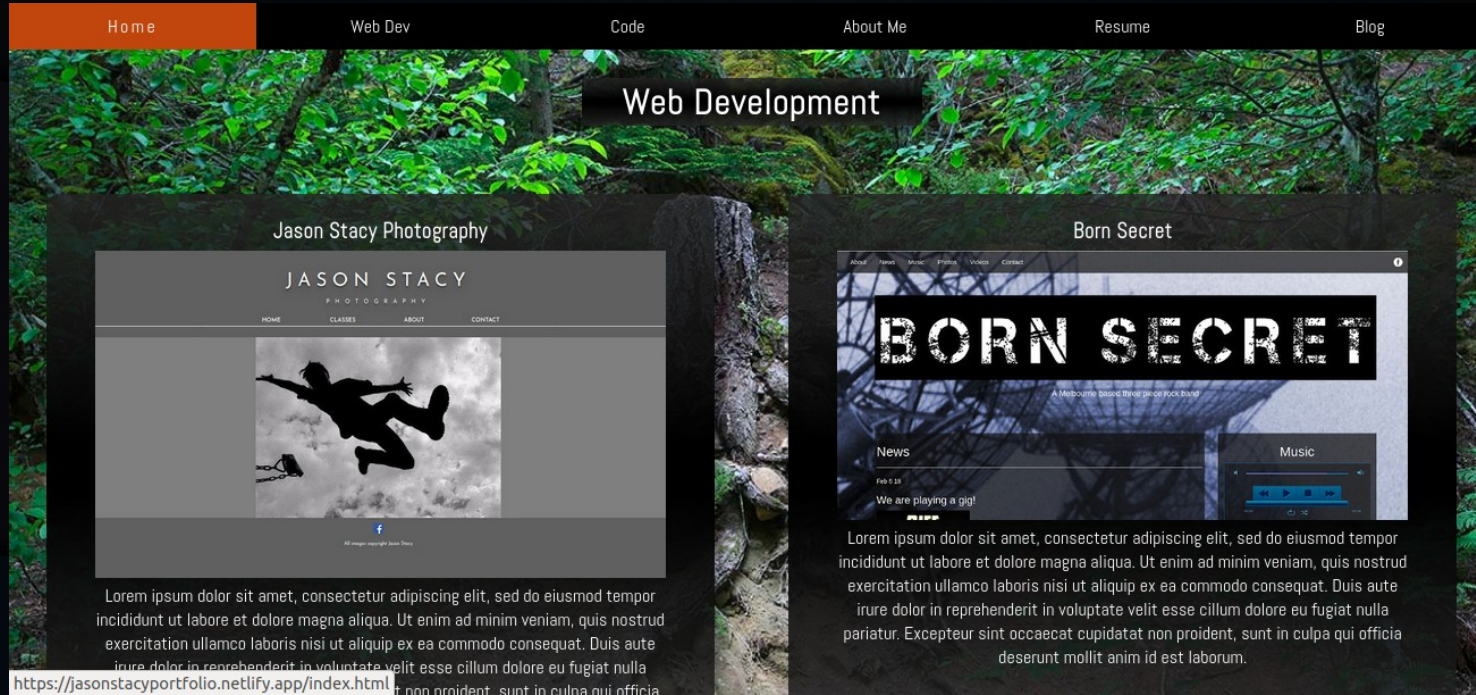

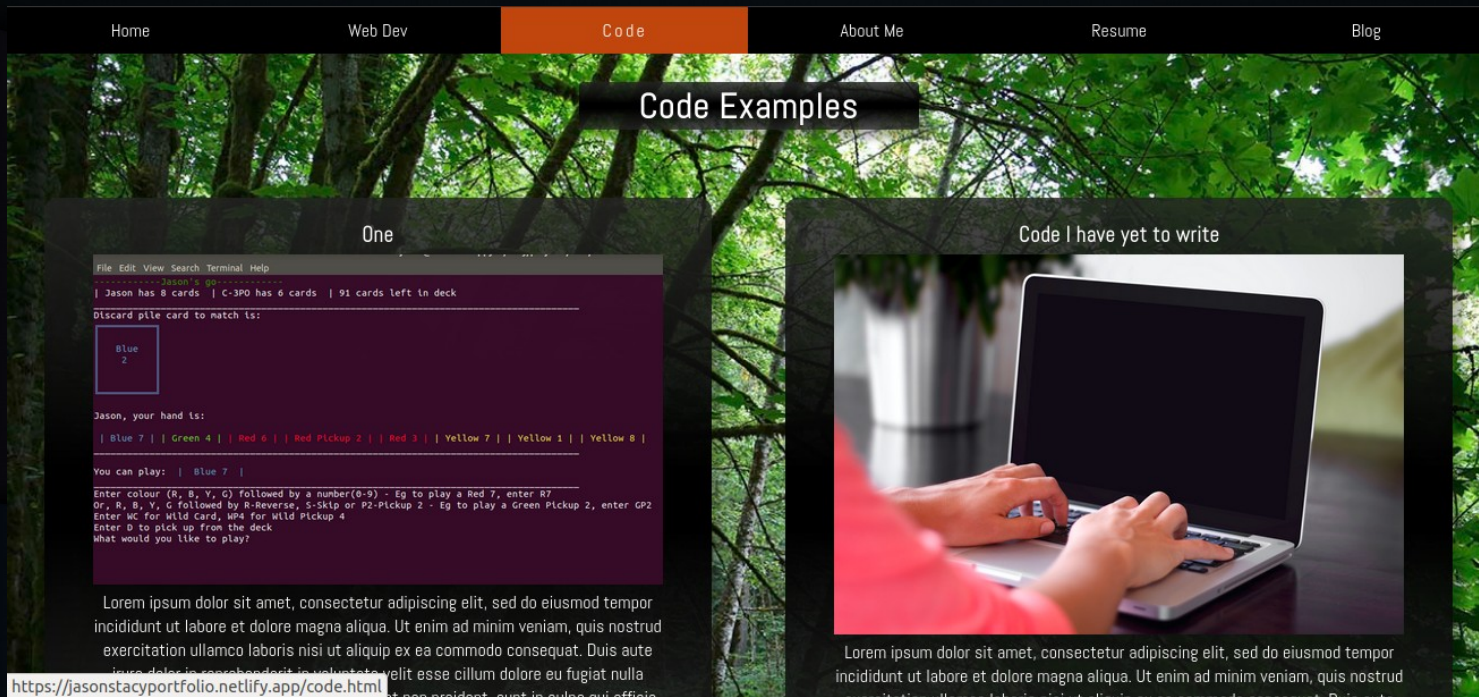

Home Screen

Parallax effect to scroll the background image slower than the foreground.
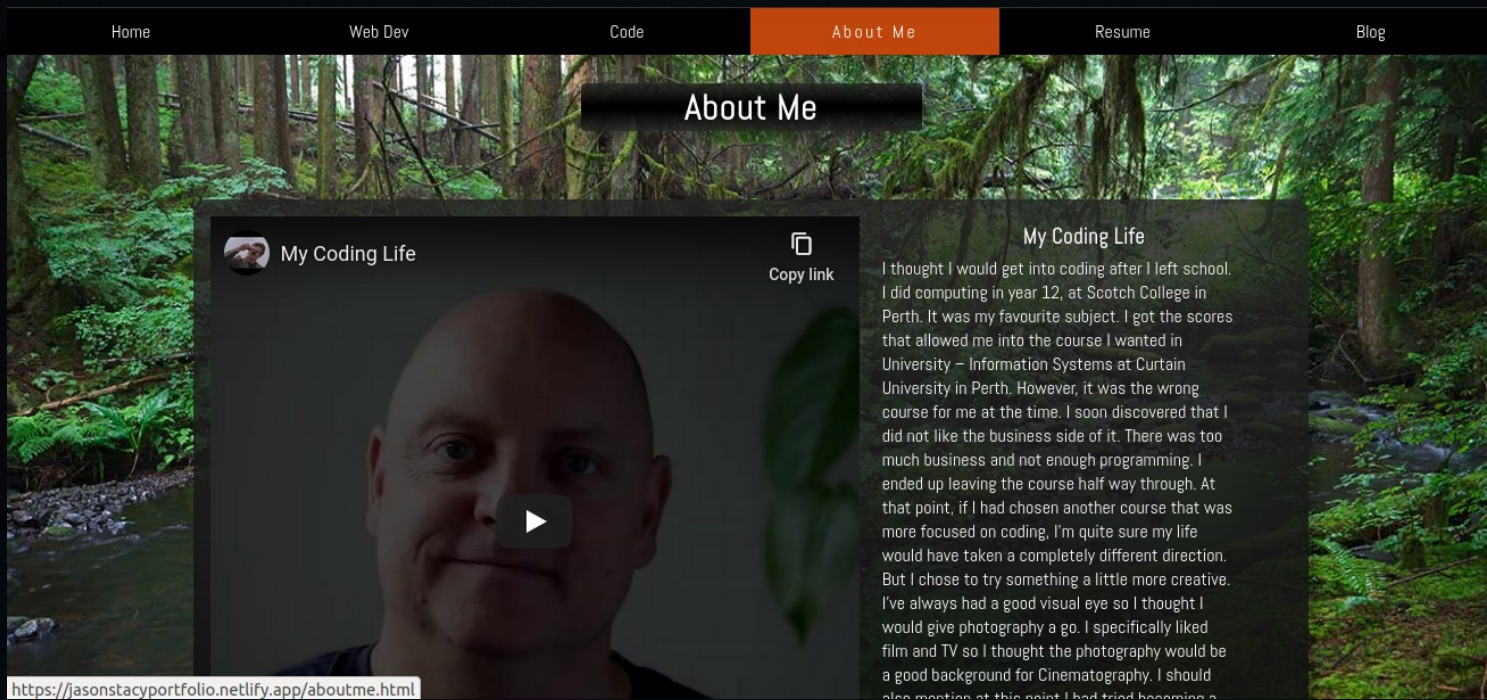

Web Development

All pages have the same navigation bar

Code

Just the one real link to my terminal assignment. The rest are mock-ups.
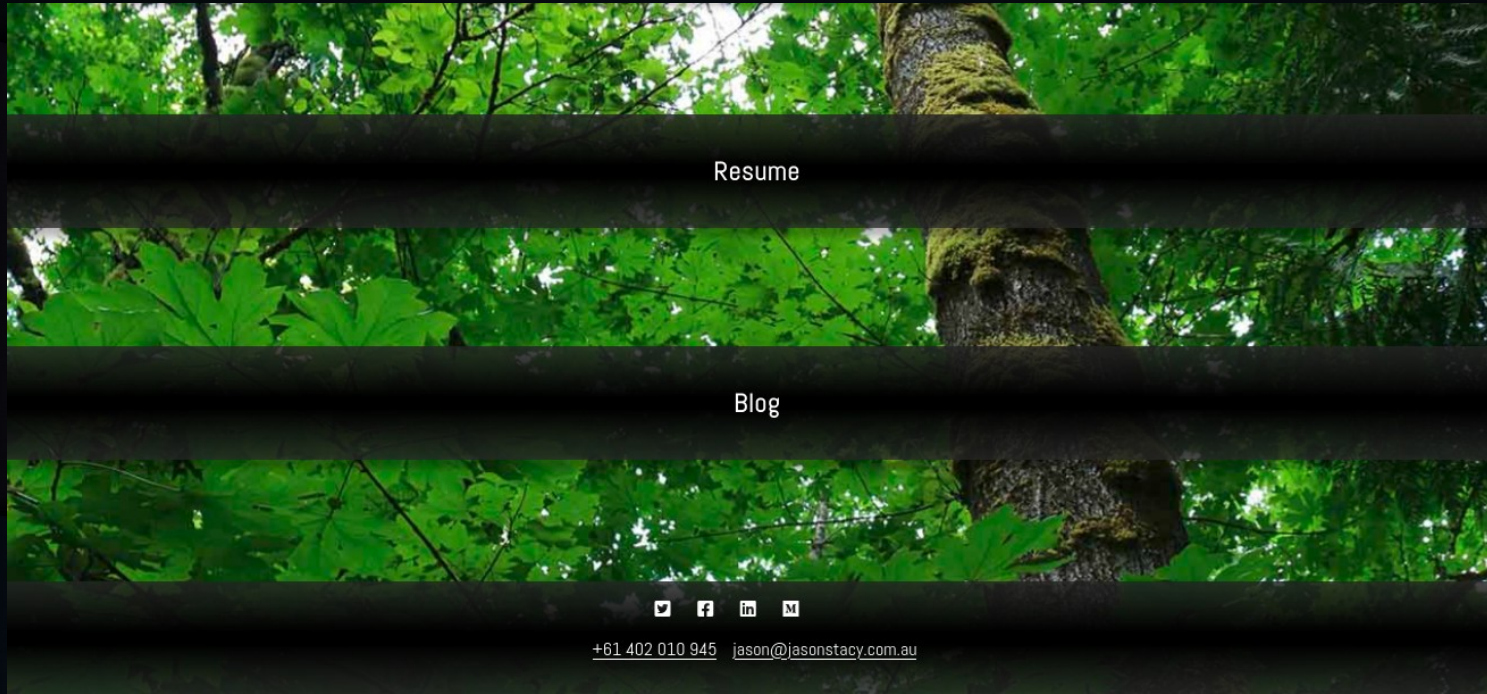

About Me

Originally, I had a photo but I decided to include a video instead.

Blog

The blog posts have drop-down content as opposed to separate pages

Footer

The footer is the same on all pages. I decided to include my contact details here too.
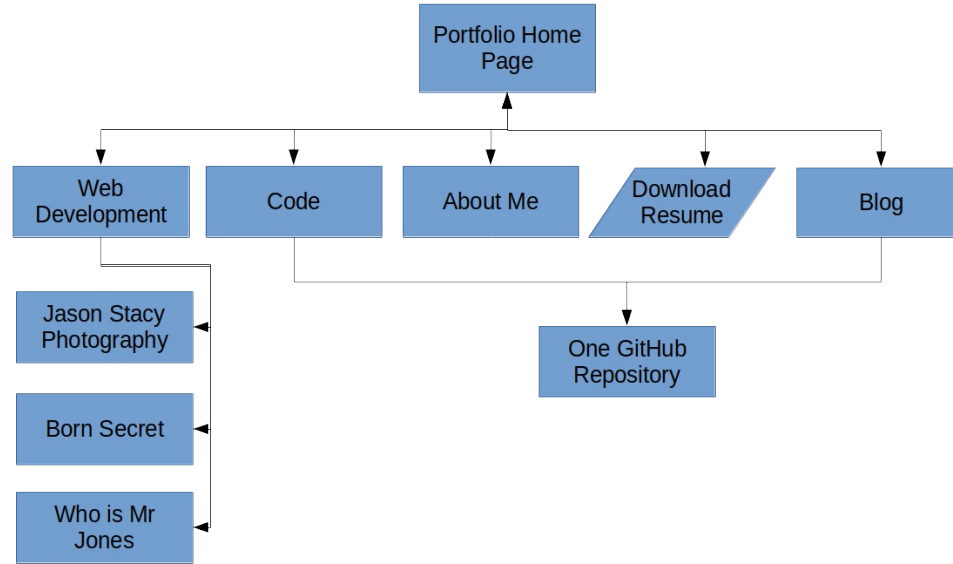

Navigation

Responsive hamburger navigation bar showing drop-down.
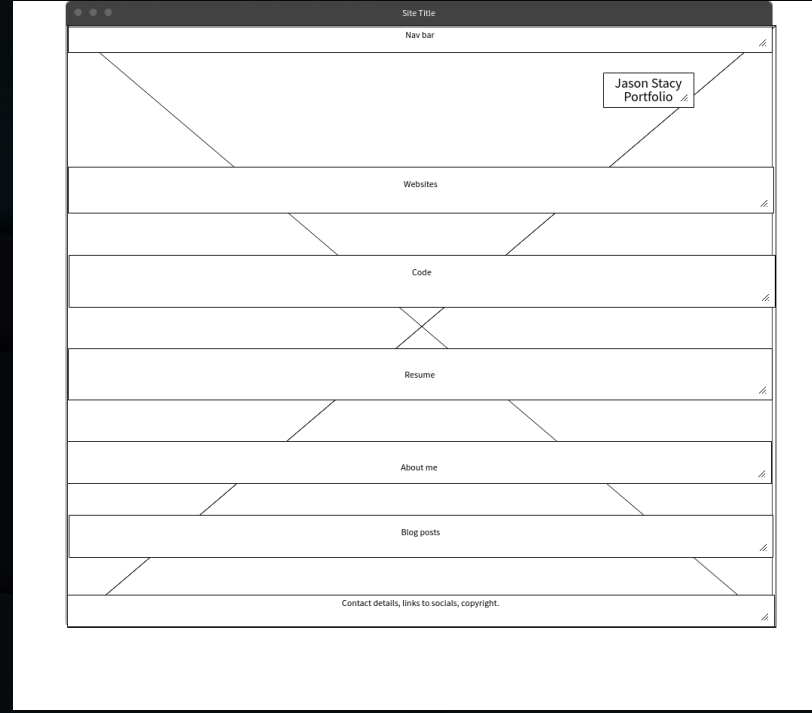

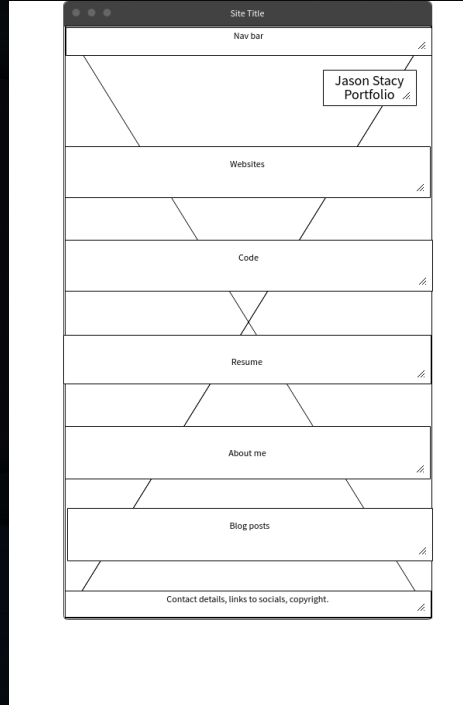

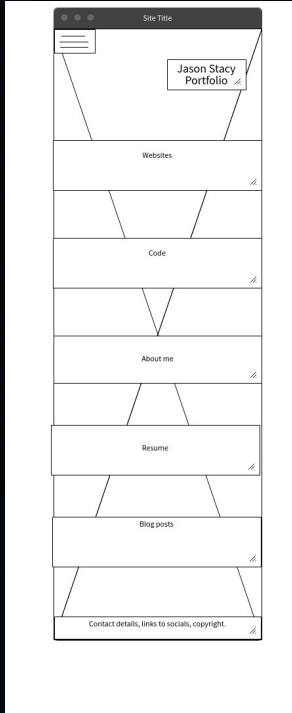

Design Process and Components

- 5 pages separating website and code examples.

- Colourful, similar, relaxing forest scenes using my photographs to create a theme.

- Parallax effect throughout.

- Create first page as a template using flex-box, then use that to create other pages.

- Simple, responsive, semi-transparent box structure with minimal colours to let the photos shine.

```

The navigation bar on all pages links to every other page.
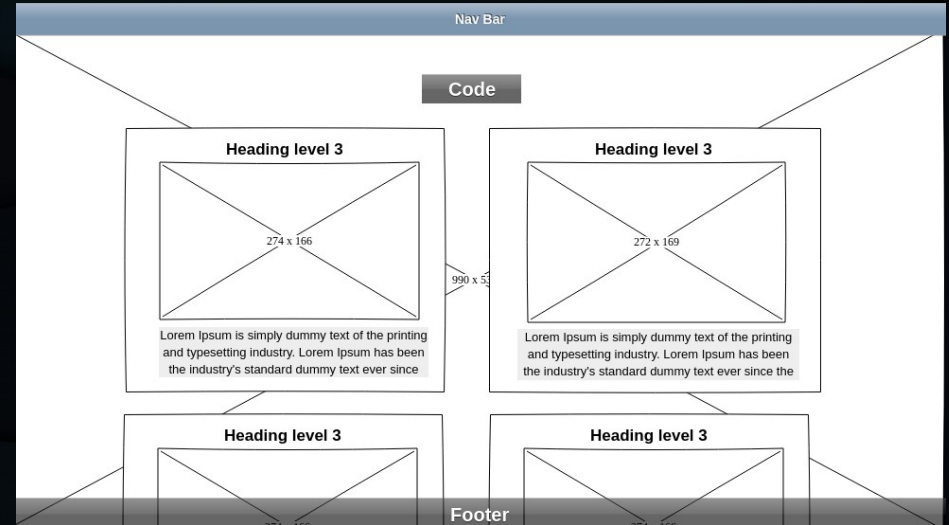

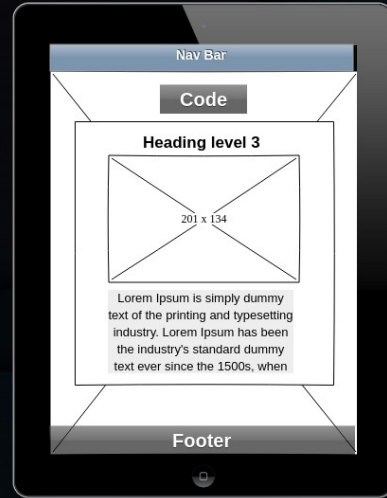

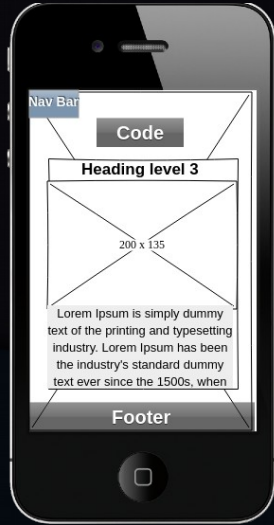

Wire-frame: Home

Simple, responsive design showing image as background
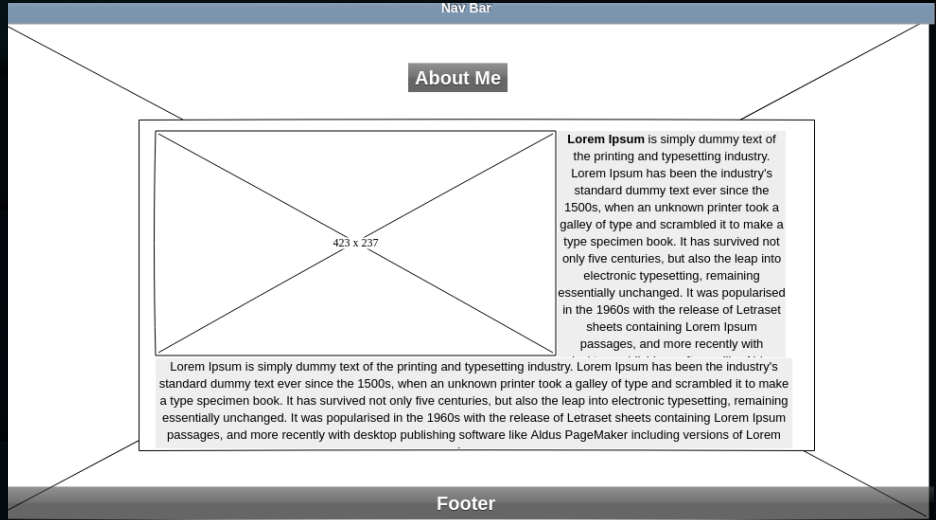

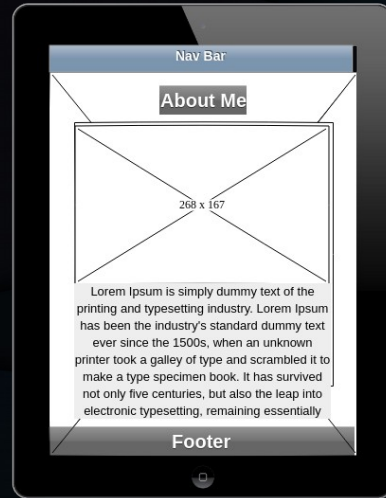

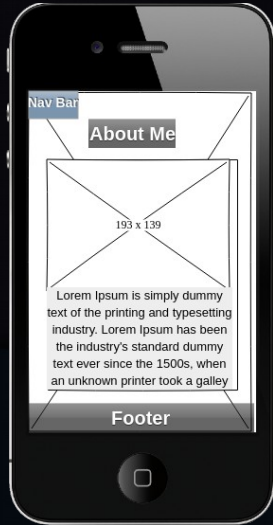

Wire-frame - Web Development

Switching to two column for desktop

Wire-frame: Code

Similar design for code page with two columns for desktop.

Wire-frame: About Me

Floating image/video left with larger box for desktop.

Wire-frame: Blog

Top showing unopened blog list and bottom showing drop-down content.

Challenges

- I researched parallax and decided I would try and do a pure CSS parallax effect.
- This worked fine until I added more pages with longer content and then it broke.
- I tried to fix it on a git branch but it was taking too much time so I compromised and left the home screen as it was and made the other pages static parallax.

Favourite Part

- My favourite part is the blog page.

- I was happy with the decision to include drop-down content as opposed to separate pages.

- Since I already had my Medium posts, I was able to use them instead of placeholder content.

- I ended up using a small amount of JavaScript to make the drop-down effect nicer.

- The responsive rules work well with the images floating to the left allowing the text to wrap.
